FLYING INSECT KILLER (COMMERCIAL) (Metered)

Recommendations

Kills & Controls Flies, Mosquitoes, small flying moths and gnats.

1. Remove protective cap and insert into special automatic dispenser. See dispenser placement below.

Where to install a dispenser containing insecticide?

1. Ideal placement is above an entrance to the room or building. This ensures the maximum potential concentration of the product at the point of entry for the insects to maintain a barrier. The movement of people through the opening helps to ensure air movement and product distribution.
2. Dispenser must be located 2-3 meters above the floor and 15 cm from the ceiling at a point where air circulation will carry particles throughout the area.
3. Use area must have at least 170 cubic meters (6,000 cubic feet) of free flow air space.
4. Do not install directly above any food handling or food dispensing area.
5. In meat packing plants, only spray when the plant is not in operation. No exposed meat products, ingredients, or packaging materials to be left in the room. Any treated surface that may contact meat food products should be washed and rinsed thoroughly with potable water after spraying and before re-use.
